Diamond Fire Web

The Ultimate Premises Based Tracking & Reporting Solution

Track and manage your premises-based information from anywhere with Diamond Fire Web (DFW).

Developed exclusively for Fire and Building Control Authorities in Ireland, DFW provides users with the flexibility to access to information, files and reports whether in the office or out on inspections.

The introduction of workflow-driven processes ensures that all necessary data is captured, helping to reduce errors and office workloads, whilst expanding operational capabilities.

Developed using the latest technology and integrating new advanced features, DFW is the most comprehensive premises management software available.

Benefits of Diamond Fire Web

- Linked functionality is included across multiple systems, including iPlan, GeoDirectory & Eircode

- Reduced costs through the central management of documents

- Import Commencement Notice data from BCMS directly into DFW

- Easily compile statistics, reports & KPI's at the touch of a button

- Access historical paper files in DFW with the Scanned Document Module

Mapping

Mapping functionality is included as standard with Diamond Fire Web. Built upon Azimap, our industry-leading web GIS software, users can extract added value from their geographic information.

With Azimap, it is possible to visualise information connected to all the premises within your operational area, helping to easily identify trends or patterns in your data.

Further analysis of your geographic information can be conducted with additional datasets to uncover specific areas to focus on, such as fire prevention methods or the need for additional safety inspections.

Future updates to Azimap will expand its capabilities with the inclusion of routing analysis, drive time analysis and buffer analysis tools.

Benefits of Mapping in DFW

✓ Manage premises information and Fire Authority assets through a location-based interface

✓ Visualisation of data enables the easy identification of trends or patterns

✓ Easily identify premises that are missing required documentation

✓ Uncover at-risk areas to target with information campaigns or which require inspection

✓ Gain further insight through the use of routing and buffer analysis tools

✓ Detect & eliminate location-based errors
